PROJECT DESIGN PHASE - I
Solution Architecture

Date	02 March 2026
Team ID	
Project Name	Heart Disease Analysis
Maximum Marks	4 Marks

Solution Architecture:

The solution architecture of this project explains how heart disease data is collected, processed, and visualized to understand important health patterns. First, a heart disease dataset is collected that contains information such as age, gender, cholesterol level, BMI, blood pressure, and lifestyle habits. This data is stored in a database where SQL is used to clean, organize, and prepare the data for analysis.

After the data is prepared, it is connected to Tableau, which is used to create charts, graphs, and interactive dashboards. These visualizations help in analyzing different risk factors and identifying patterns related to heart disease. Users can apply filters in the dashboard to explore information for different patient groups.

Finally, the results are shown through interactive dashboards and stories in Tableau. The dashboard can also be connected to a web application using Flask so that users can easily access and view the analysis online. This system helps in making the data easier to understand and supports better healthcare decision-making.
